

## CRYOSURGICAL WOUND CARE

1. The treated area may develop a blister during the first 24 hours. If you wish you may drain the blister with a sterile needle (alcohol or match), but leave the blister top in place.
2. Clean the area daily with soap and water.
3. The initial discomfort will improve during the following day.
4. If the blister roof is accidentally removed, apply Vaseline (or Aquaphor ointment) to the blister base twice daily and cover with a bandage.
5. Contact the office at 860-388-9799 if there is any evidence of infection or increasing pain.
